#### **Summary**

The ‘Diatom Flora of the Falkland Islands’ is a collaborative project between the National Museum of Wales, United Kingdom, and the Botanic Garden Meise, Belgium. This report documents 109 diatom taxa in 36 genera found at 111 locations investigated during field surveys in East and West Falkland, on Pebble Island and on Saunders Islands in 2011 and 2015.

#### **Introduction**

In 1913, Carlson published his studies on the diatom flora of the southern Atlantic region. These included investigations on the Falkland Islands, South Georgia and Antarctica (Carlson 1913). Kocielek et al. 1995, Fukushima et al. 2001, Flower 2005, Flower et al. 2012 continued floristic and ecological studies from the 1990s onwards. Flower (2005) is to date the most comprehensive study of the Falkland diatom flora. He described eleven new taxa and reported 233 taxa in total, attributing high species diversity to habitat complexity, water chemistry, climatic condition, geographical location and isolation. From 2011 onwards, new surveys of the cryptogamic flora (lichens and bryophytes) were conducted on the Falkland Islands (funded by the United Kingdom Government under DEFRA and the Darwin Initiative, grant no. DPLUS017). During these investigations diatom samples were taken as opportunities arose, subsequently extended by a larger diatom survey in 2015 funded by the

Shackleton Fund. These collections, held at the diatom collection of the National Museum of Wales (NMW), form the basis of this study.

The ‘Diatom Flora of the Falkland Islands’ is now a long-term project between the National Museum of Wales, United Kingdom, and the Botanic Garden Meise, Belgium, with the aim to publish a book in the series ‘Iconographia Diatomologica’. The study of the Falkland Island diatom flora is also part of investigations in a wider geographical area, in particular on islands in sub-Antarctic regions, Antarctica and southern parts of South America, conducted by Bart Van de Vijver. This report reflects the state of our current knowledge. Fifty species were identified to species level, but others are subject to further investigations. The species documented in light microscopy below are the most common species encountered during field surveys conducted in 2011 and 2015, but represent only a subset of all species in our current collection from the Falkland Islands.

At present we have recorded and photographed 109 taxa in 36 genera. The most species-rich genera were *Pinnularia* Ehrenberg (19) and *Eunotia* Ehrenberg (15). Species in these genera are common in low pH freshwaters and reflect the abundance of these habitats in the Falkland Islands. Other genera (number of species, subspecies or forma) found included *Psammothidium* (8), *Nitzschia* (7), *Gomphonema* (5), *Fragilaria* (4), *Planothidium* (4), *Distrionella* (2, 1), *Luticola* (3), *Navicula* (3), *Fragilariforma* (1, 1), *Staurosira* (2), *Achnanthidium* (2), *Encyonema* (2), *Humidophila* (2), *Diploneis* (2), *Caloneis* (2), *Stauroneis* (2), *Chamaepinnularia* (2), *Neidium* (2), *Frustulia* (2), *Surirella* (2), *Stauroforma* (1), *Staurosirella* (1), *Ctenophora* (1), *Platessa* (1), *Coccconeis* (1), *Achnanthes* (1), *Halamphora* (1), *Brachysira* (1), *Lecohuia* (1), *Pinnunavis* (1), *Microcostatus* (1), *Veigaludwigia* (1), *Sellaphora* (1) and *Epithemia* (1).

Detailed investigations of the genus *Eunotia* led to the submission of a manuscript: ‘Jüttner I., Van de Vijver B., Williams D.M., Lange-Bertalot H. & Ector L. A preliminary account of the species in the genus *Eunotia* (Bacillariophyta) in the Falkland Islands and species-area relationships in sub-Antarctic islands’ to the journal *Diatom Research* in December 2017. A revision of the species in the genus *Pinnularia* has started and will continue in 2018/19.

## Materials and Methods

Field surveys in the Falkland Islands were conducted in January 2011, January and February 2015, and (Shackleton-funded) in November 2015. A total of 111 sites were investigated. In 2011 and early 2015 samples were collected as opportunities arose during a lichen survey. In late 2015 more effort was made during a diatom survey, funded by the Shackleton Scholarship Fund, to cover a geographical area as wide as possible, although upland areas and islands without grazing were not visited (Fig. 1). Investigated habitats included streams, small lakes, ponds, pools, seepages, springs and damp terrestrial habitats such as moss, soil, sand and peat. Epilithic diatoms were collected by removing the biofilm on stones using toothbrushes. Diatoms growing on bryophytes were collected by removing parts of the plant; diatoms growing on soil, peat, sand or submerged sediments were sampled by removing the upper layer of the substratum with a knife or by sliding a tube across the surface of the sediment.

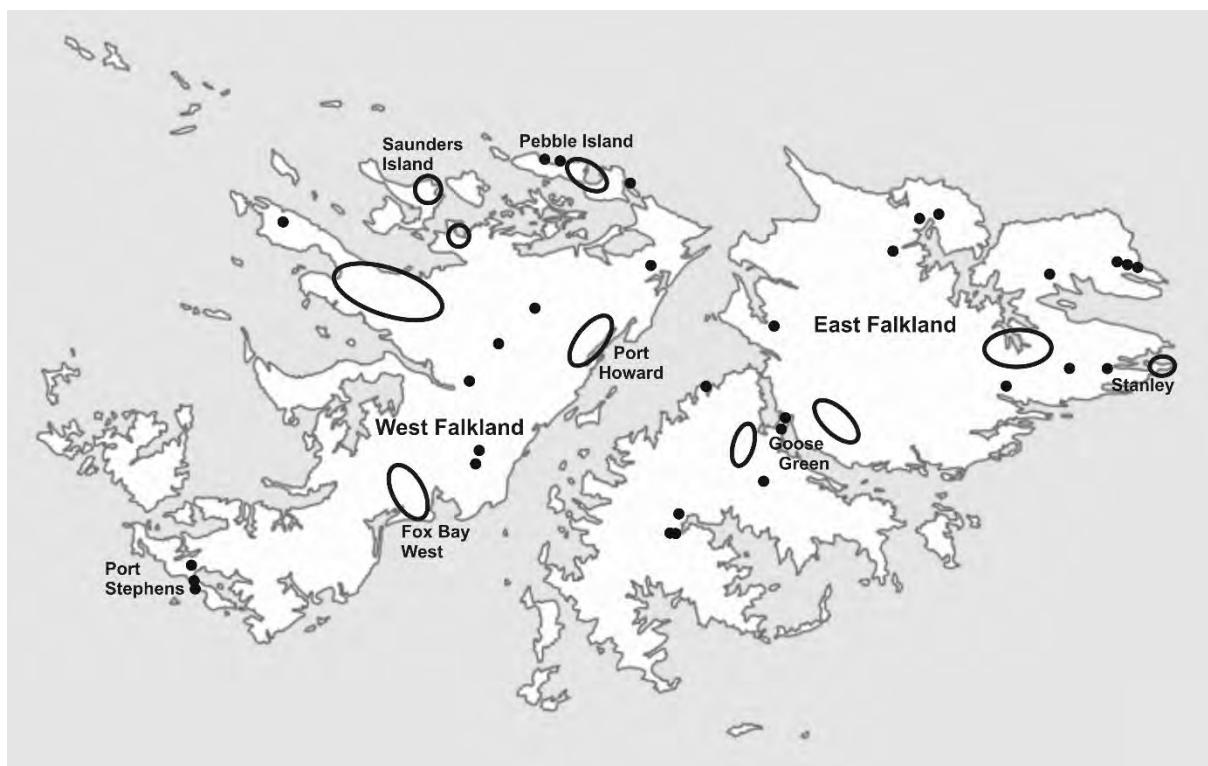

Fig.1. Study areas in the Falkland Islands.

Samples were processed using hot hydrogen peroxide ( $H_2O_2$ ) oxidation and permanent slides were made using the mountant Naphrax®. The slides were analysed using a Nikon E600 microscope (100× oil immersion objective, National Museum Cardiff, Wales), equipped with differential interference contrast (Nomarski). Images were taken using a Nikon Imaging Source 5 Megapixel CMOS Color Camera and the NIS-Elements D Software. For scanning electron microscopy (SEM) parts of the oxidized suspensions were filtered through a 1- $\mu m$  Isopore™ polycarbonate membrane filter (Merck Millipore). Parts of the filter were mounted on stubs and sputter-coated with a platinum layer of 2 nm and studied in a JEOL JSM-7100F SEM microscope at 1 kV (Botanic Garden Meise, Belgium).

Terminology largely follows Anonymous (1975) and Ross et al. (1979). Herbarium abbreviations follow *Index Herbariorum: A Global Directory of Public Herbaria and Associated Staff* (<http://sciweb.nybg.org/science2/IndexHerbariorum.asp>).

Species names are followed by the authority, and in some cases ‘References’ mention additional publications which feature the species in question. ‘Material examined’ refers to the accession number for slides and material in the diatom collection of the National Museum of Wales. All samples are accessioned in the diatom database of the National Museum of Wales using the software Filemaker Pro 15.

## Observations

### Taxonomic treatments

**Genus *Fragilariforma***

*Fragilariforma lata* (Cleve-Euler) Williams & Round (1988, p.266)

*Fragilariforma lata* var. *acuta* Flower (2005, p.62, fig.46)

**Material examined:**

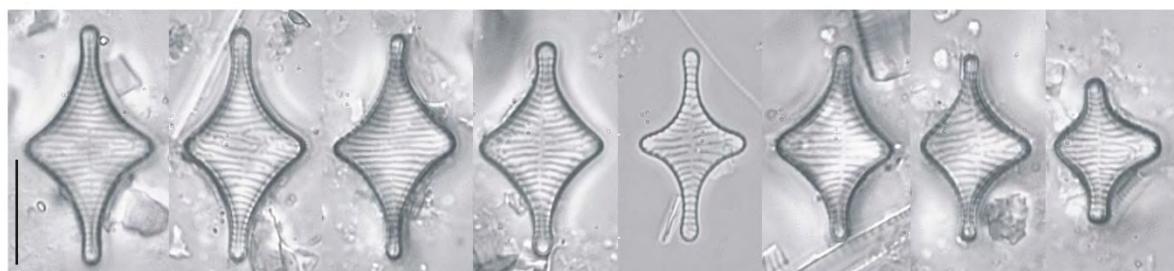

FALKLAND ISLANDS: NMW.C.2011.040.Falkland.2011.14

NMW.C.2016.003.Falkland.2015.35soil

**Remarks:**— Other similar species were described from New Zealand and from Brazil:

*Fragilariforma cassieae* C. Kilroy & E.A. Bergey (Kilroy et al. 2003, p. 538, 539, fig. 1A-K),

*F. williamsii* Metzeltin & Lange-Bert. (2007, p. 136, pl. 18, figs 1–15) and *F. stevensonii* Metzeltin & Lange-Bert. (2007, p.135, pl. 19, figs 1–15).

Division Bacillariophyta  
Subdivision Bacillariophytina  
Class Bacillariophyceae  
Subclass Fragilariophycidae  
Order Fragilariales  
Family Staurosiraceae

### Genus *Stauroforma*

*Stauroforma exiguiformis* (Lange-Bert.) R.J.

Flower, V.J. Jones & F.E. Round  
(1996, p.53–54)

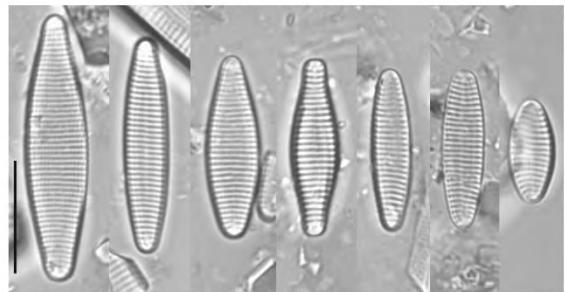

**Material examined:**

FALKLAND ISLANDS:

NMW.C.2011.040.Falkland.2011.22AO

NMW.C.2016.003.Falkland.2015.75

**Remarks:**— A similar species *Stauroforma inermis* Flower, Jones & Round (1996, p. 54, figs 23–33) was described from Antarctica.

### Genus *Staurosira*

*Staurosira proboscoidea* Lange-Bert. & Rumrich (Rumrich et al. 2000, p. 226, pl.10, figs 15–19)

**Material examined:**

FALKLAND ISLANDS: NMW.C.2016.003.Falkland.2015.29mac

**Remarks:**— A similar species *Staurosira mercedes* Lange-Bert. & Rumrich (Rumrich et al. 2000, p. 224, pl.10, figs 12–14) was described from Nicaragua.

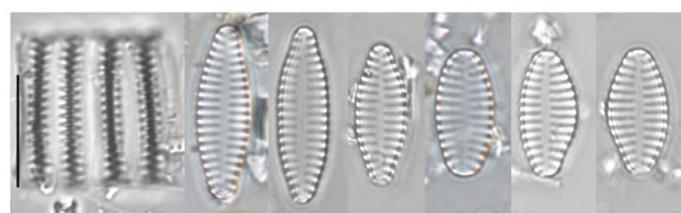

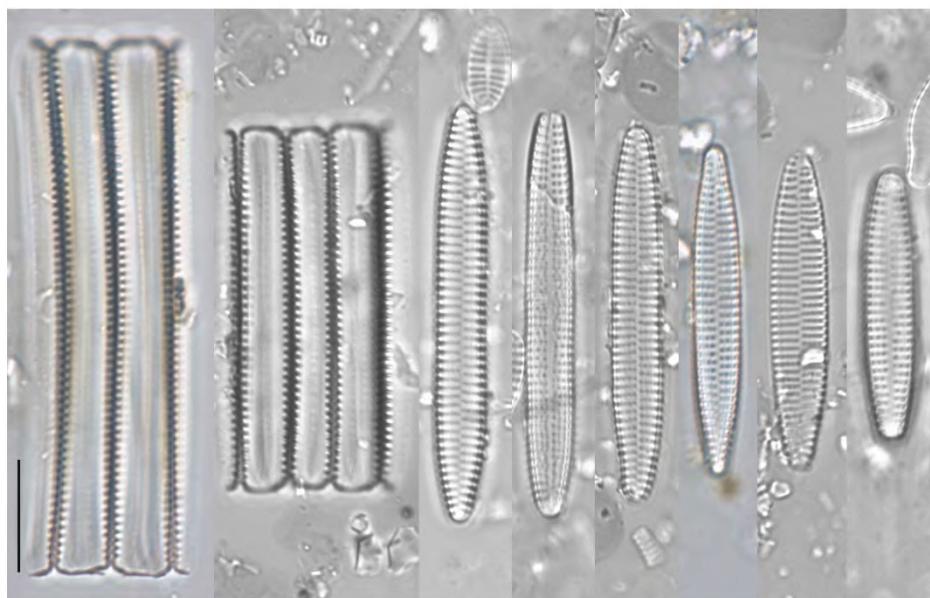

*Staurosira cf. neoproducta* (Lange-Bert.) Chudaev & Gololobova (2012, p.74, pl.2, figs 2–7, pl.4, figs 1–3)

**Material examined:**

FALKLAND ISLANDS: NMW.C.2016.003.Falkland.2015.1mac

**Remarks:**— This species is similar to *Staurosira alpestris* (Krasske) Van de Vijver (Van de Vijver et al. 2002, p.114, pl.14, figs 1–14) found on the Kerguelen and South Shetland Islands, and to *Staurosira pottiezii* Van de Vijver (Van de Vijver et al. 2014, p.257, 258, figs 1–25) described from Livingston Island, South Shetland Islands.

## Acknowledgements

We thank the Shackleton Scholarship Fund for funding the field work in the Falkland Islands in November 2015 through a grant to IJ. We thank Nick Rendell, Falkland Islands Government, for providing the research licence. We thank Alan Orange, National Museum Wales, for his help with fieldwork in November 2015, and for taking additional samples in January 2011, and in January and February 2015 during fieldwork for the project ‘Lower Plants Inventory and Conservation in the Falkland Islands’, funded by the United Kingdom Government under DEFRA and the Darwin Initiative, grant-no. DPLUS017. We thank Luc Ector, Luxembourg Institute of Science and Technology (LIST) for providing literature.
